Project Design Phase
Solution Architecture

Date	03 October 2026
Team ID	SWTID-2026-8307
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Solution Architecture:

The proposed solution uses **ServiceNow Flow Designer** to automatically classify IT incidents. When a student or teacher creates an incident, the flow reads the **Short Description** and **Description**, checks predefined keywords, and automatically assigns the appropriate category. This reduces manual classification and provides consistent ticket categorization.

The architecture is designed to:

• Capture incident requests in ServiceNow.

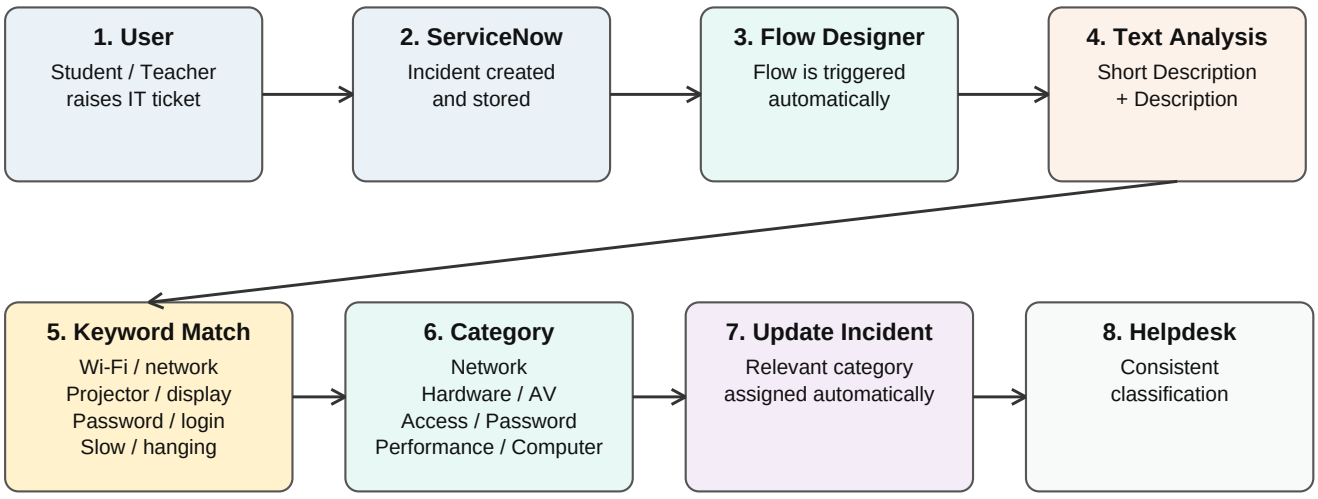
• Trigger Flow Designer when a new incident is created.

• Analyze the Short Description and Description fields.

• Match the incident text with predefined classification keywords.

• Assign the relevant category automatically.

Solution Architecture Diagram:



Example rules: Wi-Fi / network → Network | Projector / display → Hardware / AV
Password / login → Access / Password | Slow / hanging → Performance / Computer
