Project Development Phase

Performance Test

Date	08 October 2026
Team ID	SWTID-2026-8307
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	—

Model Performance Testing:

Project team shall fill the following information in model performance testing template.

S.No.	Parameter	Screenshot / Values
1.	**Data Rendered**	ServiceNow Incident records are used as the input data. The classification flow reads the **Short Description** and **Description** fields from each incident.
2.	**Data Preprocessing**	Incident text is prepared for keyword matching. Relevant terms are identified from the Short Description and Description before the classification conditions are evaluated.
3.	**Utilization of Filters**	Flow Designer conditions act as classification filters. The flow checks for keywords such as **Wi-Fi, network, internet, projector, display, screen, password, login, account, slow, hanging** and **performance**.
4.	**Calculation Fields Used**	**Classification logic:** Wi-Fi / network / internet → Network Projector / display / screen → Hardware / AV Password / login / account → Access / Password Slow / hanging / performance → Performance / Computer
5.	**Dashboard Design**	Not applicable as a Tableau dashboard. For this ServiceNow project, the equivalent output is the automatically updated Incident category after the Flow Designer executes the classification logic.
6.	**Story Design**	Not applicable as a Tableau story. The project demonstrates a process flow instead: **Incident Created** → **Flow Triggered** → **Text Analyzed** → **Keywords Matched** → **Relevant Category Assigned**.

Reference Adaptation: The source template is organized as a performance-test table. Its six parameters have been retained, while Tableau-specific functions are mapped to the corresponding ServiceNow Flow Designer concepts. No screenshots have been invented.
