Project Design Phase-II
Technology Stack (Architecture & Stack)

Date	03 October 2026
Team ID	SWTID-2026-8307
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Technical Architecture:

The deliverable includes the architectural diagram and the information required in Table-1 and Table-2. The architecture shows how a school IT incident moves from ticket creation through ServiceNow Flow Designer keyword analysis to automatic category assignment.

Example: Auto Ticket Classification for School IT Helpdesk Incidents

Project Description: The school IT Helpdesk receives multiple incident requests every day from students and teachers, such as Wi-Fi issues, projector failures, password/login problems, and slow computers. The solution automates ticket classification using ServiceNow Flow Designer by analyzing keywords from the Short Description and Description fields and assigning the relevant category.

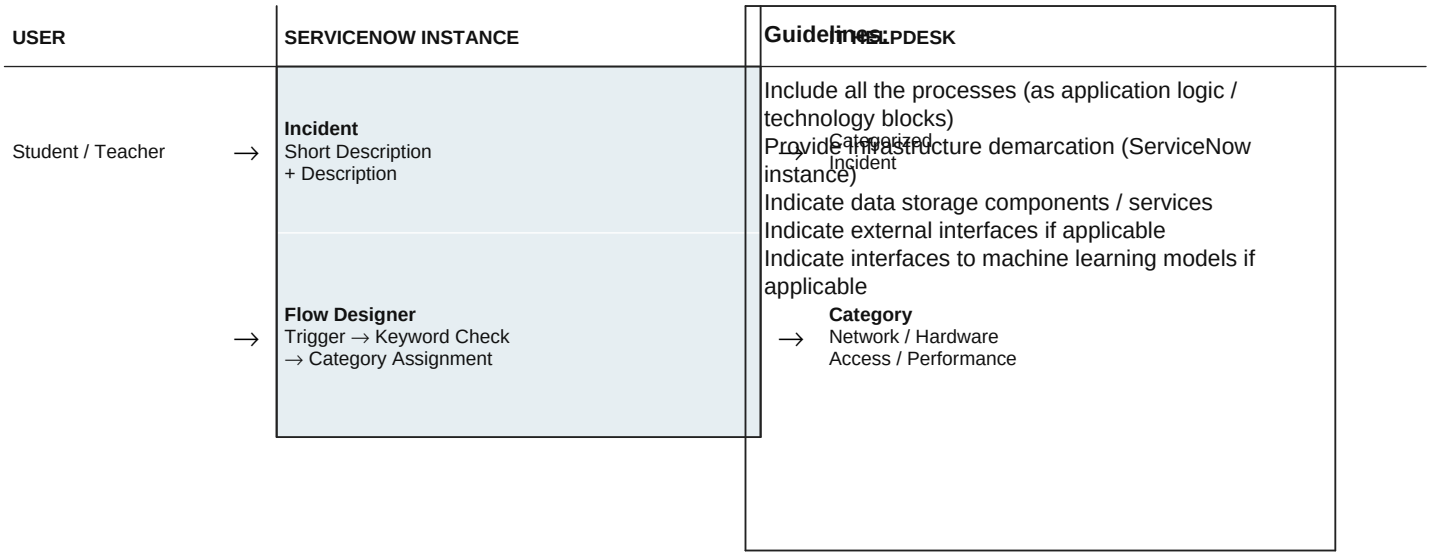

Table-1 : Components & Technologies:

S.No	Component	Description	Technology
1.	User Interface	How user interacts with the application / incident form.	ServiceNow Incident form / ServiceNow UI
2.	Application Logic-1	Trigger the automation when an incident is created or updated.	ServiceNow Flow Designer
3.	Application Logic-2	Read and evaluate the Short Description and Description fields.	Flow Designer Data Pills / Flow logic
4.	Application Logic-3	Match keywords and assign the relevant incident category.	Flow Designer If / Decision logic
5.	Database	Store incident records, descriptions and category values.	ServiceNow Incident [incident] table
6.	Cloud Database	Managed application data storage within the ServiceNow platform.	ServiceNow platform database
7.	File Storage	No dedicated file storage is required for the classification logic.	Not required / ServiceNow attachments if used
8.	External API-1	No external API is required for keyword-based classification.	Not required
9.	External API-2	No second external API is required for the workflow.	Not required
10.	Machine Learning Model	Classification is rule/keyword based; no ML model is required.	Not applicable
11.	Infrastructure (Server / Cloud)	Application deployment and workflow execution.	ServiceNow Cloud / ServiceNow instance

Table-2: Application Characteristics:

S.No	Characteristics	Description	Technology
1.	Open-Source Frameworks	List the open-source frameworks used.	Not applicable; ServiceNow Flow Designer is the primary platform component.
2.	Security Implementations	Access controls and platform security protect incident data and workflow execution.	ServiceNow roles / ACLs / authentication / platform security controls

S.No	Characteristics	Description	Technology
3.	Scalable Architecture	The workflow operates within the ServiceNow platform and can process incident records using the same reusable flow logic.	ServiceNow Flow Designer / platform architecture
4.	Availability	The workflow runs as part of the ServiceNow instance and is available when the platform is available.	ServiceNow hosted platform
5.	Performance	Keyword checks use the Short Description and Description fields and avoid external ML/API calls, reducing processing steps.	Flow Designer conditions / keyword matching
