# CUSTOMER JOURNEY MAP

**SCENARIO:** Reporting, automatically classifying, and following up on a school IT helpdesk incident using ServiceNow Flow Designer

| **Project** | **Team ID** | **Customer** | **System** |
|---|---|---|---|
| Auto Ticket Classification using Flow Designer | SWTID-2026-8307 | Students & Teachers | ServiceNow + Flow Designer |

| JOURNEY STAGE | 1. RAISE TICKET<br>Student/teacher notices an IT issue | 2. INCIDENT CREATED<br>Ticket enters ServiceNow | 3. FLOW TRIGGERED<br>Flow Designer starts automatically | 4. CLASSIFICATION<br>Keywords are analyzed and matched | 5. CATEGORY ASSIGNED<br>Relevant category is updated | 6. IT FOLLOW-UP<br>Helpdesk uses the classified ticket |
|---|---|---|---|---|---|---|
| **Steps** | User opens the IT helpdesk process and reports a problem. | Incident is created with Short Description and Description. | ServiceNow detects the new incident and starts the flow. | Flow reads both text fields and checks predefined keyword rules. | A matching category is written to the incident automatically. | IT staff review the categorized incident and continue support. |
| **Interactions** | Student/teacher → helpdesk form | User → ServiceNow incident record | ServiceNow → Flow Designer | Flow Designer → keyword/rule checks | Flow → incident category field | IT staff → categorized incident |
| **Things / Digital Touchpoints** | School helpdesk portal / ServiceNow | Incident form; Short Description; Description | Flow Designer trigger | Flow Designer conditions / decision logic | Incident record and Category field | ServiceNow incident list / assignment queue |
| **People** | Student or teacher | Student/teacher and ServiceNow | ServiceNow / automation | Automated flow; IT process owner | Automated flow; helpdesk | IT helpdesk technician |
| **Goals & Motivations** | Help me report my IT problem quickly. | Help me explain the problem clearly. | Help me avoid waiting for manual processing. | Help me get the issue classified correctly. | Help me avoid unnecessary manual categorization. | Help me get faster and more consistent IT support. |
| **Positive Moments** | Easy to report the issue. | Ticket details are captured in one record. | No manual start is required. | Classification follows defined rules consistently. | Category is available without manual review. | Staff can begin work with clearer ticket routing. |
| **Negative Moments** | User may not know what details to provide. | Incomplete descriptions can reduce classification accuracy. | A flow failure could stop automation. | Similar words may be ambiguous or absent. | A ticket may remain uncategorized when no rule matches. | Staff may need to correct exceptions manually. |
| **Areas of Opportunity** | Guide users with examples for useful descriptions. | Validate required incident information. | Add error handling and flow execution logging. | Expand and maintain keyword-to-category rules. | Add a default/Review Needed category for unmatched tickets. | Track corrections to improve future classification rules. |

**Journey outcome:** A new school IT incident moves from user reporting to an automatically assigned category through keyword-based Flow Designer logic. Unmatched or ambiguous tickets can be routed for review rather than forcing an incorrect category.
