Project Design Phase

Proposed Solution Template

Date	03 October 2026
Team ID	SWTID-2026-8307
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	The school IT Helpdesk receives multiple incident requests from students and teachers. IT staff currently review the Short Description and Description manually and assign a category. This takes time and can result in inconsistent classification of Wi-Fi, projector, password/login, and computer-performance issues.
2	Idea / Solution description	Use **ServiceNow Flow Designer** to automatically classify new incidents. When an incident is created, the flow analyzes the Short Description and Description, matches predefined keywords, and updates the incident with the relevant category. Example mappings include Wi-Fi/network/internet → Network; projector/display/screen → Hardware / AV; password/login/account → Access / Password; and slow/hanging/performance → Performance / Computer.
3	Novelty / Uniqueness	The solution applies lightweight keyword-based classification directly within the existing ServiceNow incident workflow using Flow Designer. It reduces the need for a separate classification application while providing consistent, rule-based categorization at the point when the incident is created.
4	Social Impact / Customer Satisfaction	Students and teachers can receive a more organized helpdesk process, while IT staff spend less time performing repetitive categorization. More consistent ticket categories can support clearer routing and quicker identification of common school IT issues.
5	Business Model (Revenue Model)	The proposed project is intended for school IT operations and does not require a direct customer revenue model. Its value is operational: reducing manual effort, improving classification consistency, and making better use of existing ServiceNow capabilities. For an institution, these improvements can translate into time and support-cost savings.
6	Scalability of the Solution	The rule set can be expanded with additional keywords and categories as new incident types appear. The same Flow Designer approach can support larger ticket volumes and additional school IT categories, while unmatched incidents can be routed for manual review or a future classification enhancement.
