Functional & Performance Testing

Model Performance Test

Date	08 October 2026
Team ID	SWTID-2026-8307
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	—

Test Scenarios & Results

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
FT-01	Incident Text Input Validation	Create incidents with valid and empty/irrelevant Short Description and Description values.	Valid incident text is accepted and the Flow processes the record without failure.	To be recorded during testing.	
FT-02	Wi-Fi / Network Classification	Create an incident containing keywords such as Wi-Fi, network or internet.	Incident category is automatically assigned as Network.	To be recorded during testing.	
FT-03	Projector / Display Classification	Create an incident containing Projector, display or screen keywords.	Incident category is automatically assigned as Hardware / AV.	To be recorded during testing.	
FT-04	Password / Login Classification	Create an incident containing Password, login or account keywords.	Incident category is automatically assigned as Access / Password.	To be recorded during testing.	
FT-05	Performance Classification	Create an incident containing slow, hanging or performance keywords.	Incident category is automatically assigned as Performance / Computer.	To be recorded during testing.	
FT-06	Flow Trigger Check	Create a new incident and verify that the configured Flow Designer flow is triggered.	The flow executes automatically after incident creation.	To be recorded during testing.	
FT-07	Multiple Keyword Handling	Create incidents containing more than one relevant keyword and observe the selected category.	The configured keyword logic assigns the appropriate category consistently.	To be recorded during testing.	
FT-08	Unmatched Keyword Handling	Create an incident whose text does not contain any configured classification keyword.	The system handles the ticket according to the configured default/unmatched rule without flow failure.	To be recorded during testing.	
PT-01	Flow Response Time Test	Create an incident and measure the time between creation and automatic category assignment.	Category assignment should complete within an acceptable response time for helpdesk use.	To be recorded during testing.	
PT-02	Multiple Incident Load Test	Create multiple incident records in a short period and observe Flow Designer execution.	Tickets should be processed consistently without failures or significant slowdown.	To be recorded during testing.	
PT-03	Repeated Classification Test	Submit repeated incidents using the same keyword patterns and compare the results.	The same keyword pattern should produce consistent category assignments.	To be recorded during testing.	

Note: Actual Result and Pass/Fail fields are intentionally left for project testing evidence and final execution results.
