# Auto Ticket Classification using Flow Designer

## Project Documentation

## 1. Introduction

- Project Title: Auto Ticket Classification using Flow Designer
- Team ID: SWTID-2026-8307
- Team Members: List team members and their roles.

## 2. Project Overview

- Purpose: Automate the classification of school IT helpdesk incident tickets using ServiceNow Flow Designer.
- Problem: IT staff manually review each incident and assign a category, which is time-consuming and can lead to inconsistent classification.
- Features: Analyze keywords from Short Description and Description and automatically assign the relevant category.

## 3. Architecture

- Platform: ServiceNow.
- Flow Logic: A Flow Designer flow is triggered when an incident is created.
- Input: Incident Short Description and Description.
- Processing: Keywords are matched against predefined classification rules.
- Output: The relevant incident category is assigned automatically.

## 4. Setup Instructions

- Prerequisites: Access to a ServiceNow instance with Incident and Flow Designer functionality.
- Configuration: Configure the Incident flow trigger, keyword rules, and category assignment action.
- Classification Rules: Configure keyword-to-category mappings for supported ticket types.

## 5. Folder Structure

- ServiceNow Application: Incident configuration and Flow Designer components.
- Flow Designer: Trigger, keyword matching logic, and category assignment actions.
- Documentation: Project documentation, testing evidence, and screenshots.

## 6. Running the Application

- Create an incident in ServiceNow.
- The Flow Designer flow is triggered when the incident is created.

- Short Description and Description are analyzed.
- Matching keywords are evaluated and the relevant category is assigned automatically.

## 7. API Documentation

- The project is implemented using ServiceNow Flow Designer. No separate custom backend API is specified in the supplied project description.
- ServiceNow incident data is used as the flow input.

## 8. Authentication

- Access to ServiceNow incident records is controlled through ServiceNow user access and permissions.
- Specific authentication configuration is not defined in the supplied project description.

## 9. User Interface

- The user raises an IT helpdesk incident through the ServiceNow incident interface.
- Short Description and Description are the key classification inputs.
- The automatically assigned category can be viewed in the incident record.

## 10. Testing

- Test Wi-Fi, network, or internet incidents → Network.
- Test projector, display, or screen incidents → Hardware / AV.
- Test password, login, or account incidents → Access / Password.
- Test slow, hanging, or performance incidents → Performance / Computer.

## 11. Screenshots or Demo

- Include screenshots showing incident creation, Flow Designer configuration, keyword matching logic, and the resulting automatically assigned category.

## 12. Known Issues

- Classification depends on predefined keyword rules.
- Tickets with unclear, missing, or unsupported keywords may require manual review.
- Handling of multiple conflicting keyword matches is not defined in the supplied project description.

## 13. Future Enhancements

- Expand keyword and category rules for additional IT incident types.
- Add handling for multiple or conflicting keyword matches.
- Introduce advanced text classification for varied user descriptions.
- Add reporting to measure classification accuracy and identify tickets requiring manual review.
